

Abstract of the Disclosure

5 A diagnostic tool for an audio mixing system has an information
source storing at least interconnection characteristics and apparatus settings
in the system, relative to channel inputs, a search function accessible by a
user, which upon initiation polls the information source, and search criteria
associated with the search function for establishing specific information to be
10 matched in a search. Initiation of the search function causes the search
function to poll the information source, and to return channel numbers for
those channels that match the search criteria. Criteria can be specific to
hardware and/or software.
